

Poultry Bed from Peat Bed is an innovative bedding material for bedding birds (Broilers, Ducks, Hens & Turkeys). The peat has been specially graded for use in the Poultry industry.

The peat is harvested and screened to obtain the optimum particle size which is fine friable peat. The acidic pH of the bedding keeps harmful bacteria at bay.

Poultry Bed ensure a clean, dry and comfortable bed for the animal, it also eliminates the need for the farmer to continuously replenish the bedding material as the absorption capacity with the material lasts much longer than standard bedding material, saving time and effort.

Poultry Bed is made from a mixture of high grade dry peat that is super fine peat.

Poultry Bed is available for delivery worldwide (Currently supplying nationwide, UK, Belgium & Sth Africa) in a range of packaging to suit the needs and budgets of farmers. We provide bulk bags, pallets or bulk lorry loads.

Why use “Poultry Bed”?

Absorption

The capacity for absorption with **Poultry Peat** is much greater, with Peat holding 10 times its own weight in moisture (shavings or straw absorption rate is between 2.5 or 4 times at most). In average conditions, a single application of **Poultry Bed** will maintain a clean, dry and healthy environment for your crop throughout its housed lifetime (for broilers). Rate of bedding = .6m³ per 1000 birds.

Low pH

Poultry Bed has a very low pH value of 4, this helps to neutralise the high pH value of the urine from poultry which eliminates smell of ammonia in the house and leaves the bedding less susceptible to harbouring harmful bacteria, (straw pH value 8.5-9.5, shavings pH value 6).

Poultry Comfort

Chickens natural habit is to scrape, scratch and dust themselves. Poultry Peat is super fine and dry which promotes this natural animal habit and with its high moisture absorption rate eliminates caking often found in traditional bedding underneath your drinkers and at the edges of your unit.

Creature Comfort

Poultry Bed lasts longer, keeps birds healthier, cleaner and gives better returns than any of the competitors. Straw and Wood Shaving beddings can cause or promote lesions in the feet and create an environment that results in breast blisters for the bird. The feedback from poultry farmers using our **Poultry Bed** have seen remarkable improvements in the health and welfare of the birds since they changed to **Poultry Bed**.

High Humidity

When birds are hatched, the environment is high in humidity (90/95%), the moisture of the Peat is <50%. Trials have shown that the paper you put down for day old birds to feed stays dry but moisture level in **Poultry Bed** help to keep humidity in the house high, which helps day old birds as they are hatched in a high humidity environment which results in less stress to day old birds at a vulnerable time therefore less mortality.

Value added Finished Product

The soil conditioning properties of Peat will add value to the finished product when the batch is finished (excellent organic fertiliser value).
